

Experiment 5

Student Name: Satyakam Tyagi

Branch: BE-IT

Semester: 6th

Subject Name: Project based learning in Java

UID: 22BET10013

Section/Group: 22BET_IOT-701/A

Date of Performance: 18-02-25

Subject Code: 22ITH-359

Problem 1: Write a Java program to calculate the sum of a list of integers using autoboxing and unboxing. Include methods to parse strings into their respective wrapper classes (e.g., Integer.parseInt()).

1. Objectives:

- Demonstrate the use of autoboxing (automatic conversion of primitive types to their wrapper class objects) and unboxing (automatic conversion of wrapper class objects to primitive types) while performing arithmetic operations.
- Implement methods to convert string representations of numbers into their respective wrapper classes using methods like Integer.parseInt().
- Sum the list of integers while ensuring the use of autoboxing and unboxing to demonstrate their effect.

2. Code:

```
import java.util.ArrayList; import
java.util.List; import java.util.Scanner;

public class SumOfIntegers {

    // Method to parse a string into an Integer
    public static Integer parseStringToInteger(String str) { try { return
        Integer.parseInt(str);
    } catch (NumberFormatException e) {
        System.out.println("Invalid input: " + str + " is not a valid integer."); return
        null; // Return null if parsing fails } }

    // Method to calculate the sum of a list of integers public static
    int calculateSum(List<Integer> integers) { int sum = 0;
        for (Integer number : integers) { //
            Unboxing: Integer to int sum +=
            number;
        }
    }
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
        return sum;
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        List<Integer> integerList = new ArrayList<>(); System.out.println("Enter
        integers (type 'done' to finish):");

        while (true) {
            String input = scanner.nextLine(); if
            (input.equalsIgnoreCase("done")) {
                break; // Exit the loop if the user types 'done'
            }
            Integer number = parseStringToInteger(input);
            if (number != null) { // Autoboxing: int to
                Integer integerList.add(number);
            }
        }

        // Calculate the sum of the integers in the list int
        sum = calculateSum(integerList);
        System.out.println("The sum of the entered integers is: " + sum);

        scanner.close();
    }
}
```

3. Output:

```
Enter integers (type 'done' to finish):
2
4
5
6
7
4
5
6
done
The sum of the entered integers is: 39|
```

Fig:1 Sum of elements of array

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

4. Learning Outcomes:

- Learn how Java automatically converts primitive types to their corresponding wrapper classes (autoboxing) and vice versa (unboxing).
- Recognize the importance of autoboxing/unboxing in arithmetic operations and collections like ArrayList<Integer>.
- Gain experience in working with Java wrapper classes (Integer, Double, etc.).
- Learn how to convert string representations of numbers into their respective wrapper types using methods like Integer.parseInt().

Problem 2: Create a Java program to serialize and deserialize a Student object. The program should:

- Serialize a Student object (containing id, name, and GPA) and save it to a file.
- Deserialize the object from the file and display the student details.
- Handle FileNotFoundException, IOException, and ClassNotFoundException using exception handling.

1. Objectives:

- Serialize a Student object (id, name, GPA) and save it to a file.
- Deserialize the object from the file and display student details.
- Handle FileNotFoundException, IOException, and ClassNotFoundException using exception handling.

2. Code:

```
import java.io.*; import
java.util.Scanner;
```

```
class Student implements Serializable { private static final long
serialVersionUID = 1L; // For serialization private int id; private
String name;
private double gpa;
```

```
public Student(int id, String name, double gpa) {
    this.id = id; this.name = name; this.gpa = gpa;
}
```

```
public int getId() { return id;
}
```

```
public String getName() { return name;
}
public double getGpa() {
    return gpa;
}
```

```
@Override
public String toString() {
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

Discover. Learn. Empower.

```
        return "Student ID: " + id + ", Name: " + name + ", GPA: " + gpa; }
    }

    public class StudentSerialization { private static final

        String FILE_NAME = "student.ser";

        public static void serializeStudent(Student student) {
            try (ObjectOutputStream oos = new ObjectOutputStream(new
                FileOutputStream(FILE_NAME))) {
                oos.writeObject(student);
                System.out.println("Student object serialized successfully.");
            } catch (FileNotFoundException e) {
                System.out.println("File not found: " + e.getMessage());
            } catch (IOException e) {
                System.out.println("IOException occurred: " + e.getMessage());
            }
        }

        public static Student deserializeStudent() { Student
            student = null;
            try (ObjectInputStream ois = new
                ObjectInputStream(new FileInputStream(FILE_NAME))) {
                student = (Student) ois.readObject();
                System.out.println("Student object deserialized successfully.");
            } catch (FileNotFoundException e) {
                System.out.println("File not found: " + e.getMessage());
            } catch (IOException e) {
                System.out.println("IOException occurred: " + e.getMessage());
            } catch (ClassNotFoundException e) {
                System.out.println("Class not found: " + e.getMessage());
            }
            return student;
        }

        public static void main(String[] args) {
            Scanner scanner = new Scanner(System.in);
            int choice;
            do {
                System.out.println("\nMenu:");
                System.out.println("1. Serialize Student");
                System.out.println("2. Deserialize Student");
                System.out.println("3. Exit");
                System.out.print("Enter your choice: "); choice
                    = scanner.nextInt();
            } while (choice != 3);
        }
    }
}
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

scanner.nextLine(); // Consume newline
Discover. Learn. Empower.

```
switch (choice) { case  
1:
```

```
    System.out.print("Enter Student ID: "); int  
    id = scanner.nextInt(); scanner.nextLine();  
    //          Consume          newline  
    System.out.print("Enter Student Name:  
    ");  
    String name = scanner.nextLine();  
    System.out.print("Enter Student GPA: ");  
    double gpa = scanner.nextDouble();
```

```
    Student student = new Student(id, name, gpa);  
    serializeStudent(student);  
    break;
```

```
case 2:
```

```
    Student deserializedStudent = deserializeStudent(); if  
    (deserializedStudent != null) {  
        System.out.println("Deserialized Student Details: " + deserializedStudent);  
    }  
    break;
```

```
case 3:
```

```
    System.out.println("Exiting the program."); break;
```

```
default:
```

```
    System.out.println("Invalid choice. Please try again."); }  
} while (choice != 3);
```

```
scanner.close();
```

```
}
```

```
}
```

3. Output:

```
Console x
<terminated> fifth3 [Java Application] C:\Users\jandy\p2\poo\plugins\org.eclipse.justi.openjdk.hotspot.jre.full.win32.x86_64_2

Menu:

4. Learning Outcomes:

- Understand the concept of object serialization and deserialization in Java.
- Learn how to convert a Java object into a byte stream and save it to a file.
- Gain knowledge of reading and converting a byte stream back into a Java object.

Problem 3: Create a menu-based Java application with the following options. 1.Add an Employee
2. Display All 3. Exit If option 1 is selected, the application should gather details of the employee like employee name, employee id, designation and salary and store it in a file. If option 2 is selected, the application should display all the employee details. If option 3 is selected the application should exit.

1. Objectives:

1. Create a menu with options to add an employee, display all employees, or exit.
2. Add employee details (name, id, designation, salary) and store them in a file.
3. Display all employee details from the file.

2. Code:

```
import java.io.*; import
java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
```

```
class EmployeeRecord implements Serializable { private static final
long serialVersionUID = 1L; // For serialization private String
name; private int id;
```

DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

private String designation; private
double salary;

```
public EmployeeRecord(String name, int id, String designation, double salary) {  
    this.name = name; this.id = id;  
    this.designation = designation; this.salary  
    = salary;  
}
```

@Override

```
public String toString() { return "Employee ID: " + id + ", Name: " + name + ",  
    Designation: " + designation + ", Salary: " + salary;  
}  
}
```

```

4. Learning Outcomes:

- Learn how to create a menu-driven application in Java.
- Understand how to gather user input and store it in a file.
- Gain experience in reading from and displaying data stored in a file.
- Develop skills in managing application flow with user-driven options.
